                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       synthetic construct.
synthetic construct
artificial sequence.
I (bases 1 to 201)
Garvin, R.T. and James, E.
Production of active proteins containing cystine residues
Patent: EP 0222779-A 6 20-MAY-1987;
Cangene Corporation
unclassified.

by prepn of single stranded template, annealing a primer, elongation,
misincorporation, completion of molecules and screening.

Disclosure; p; English.

Random point mutations were introduced into the alpha fragment of
E.coli beta galactorsidase. The wild type sequence was obtained as a
Single stranded template and an oligonucleotide was hybridised to
it to generate a popn of DNA molecules which terminate at all
possible nucleotide positions within a specified region. The
variable 3' ends generated in this way are used as primers for
reverse transcriptase. Nucleotides are misincorporated by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The sequence covers all 176 difft base substitutions, most of which occurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                            MK14

It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also 051735-45 and 051747-59.

CTALS generic formula can be represented as follows: XTGC)(NNB)10-

CTCC)(NNB)5Z(NNB)2TGC)(NNB)14(TGC)Y. X and Y are flanking restriction

Sites (X is not the same as Y) that are not specified further. This

Sequence generates peptides that are cloverleaf in structure. Other

CC generated by these generic sequences are shown in R65150-54. Takks are

A method for treating airway disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for the human endothelin-1, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways. Sequence 178 BP; 0 A; 52 C; 46 G; 32 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Introducing random point mutations into nucleic acods - by prepn of single stranded template, annealing a primer, elongation, misincorporation, completion of molecules and screening. Tidentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins
FT comprising a binding domain and an effector domain
Disclosure; Page 35; 255pp; English.

Comprising a binding domain and an effector domain
Disclosure; Page 35; 255pp; English.

COV468 is a generic DNA sequence used to generate random TSAR (Totally COV468 is a generic DNA sequence used to generic formula can also be represented as follows: X(NNB)11(TGC)(NNB)7(TGC)(NNB)10Y. X

COMPRISION TO THE SATIATION SILES (X is not the same as Y) that are not specific peptides generated by these generic sequences are shown in COVAET Specific peptides generated by these generic sequences are shown in CR6151-54. TSARS are concatenated beterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with a light for a light and and a second effector peptide portion that is chanically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed conferses of peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confers some degree of conformational rigidity to the peptides. The TSARS or comprise a live to the peptides.
                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                              2093 AGGAGGCGGGGGCGCGCCGCTGTAGTTGAGCACGTGAACAGTGCCTTCACCCTC 2034

TSAR; totally synthetic affinity reagent; synthetic; binding domain; effector domain; concatenated heterofunctional protein; linker; direct; rapid; detection; screening; treatment; generic; ss.
single stranded template and an oligonucleotide was hybridised to it to generate a popp of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which see also P80575.
                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /*tag= a

deliver a chemically or biologically active moiety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal artibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tidentifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins promprising a brinding domain and an effector domain bisclosure; Page 35; 255pp; English.

Disclosure; Page 35; 255pp; English.

Comprising a brinding domain and an effector domain bisclosure, Page 35; 255pp; English.

Comprising a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reasperts) peptides. This generic formula can also be represented as follows: X(NNB)16(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(NNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)12(TGC)(TNB)1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cell. They can also replace the function of macromolecules, eg. amonoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 BP: 5 A: 10 C; 0 G;
10-APR-1995 (first entry)
Generic DNA sequence to generate a random TSAR peptide library.
TSAR, totally synthetic affinity reagent; synthetic; binding domain;
effector domain; concatenated heterofunctional protein; linker;

COT0465 is a generic DNA Sequence used to generic sequences are shown in COT0465 is and Y are flanking restriction Sites (X is not the same as Y) that are

COT0465 is a generic OT0465 generic sequences are shown in COT0465 generic sequences are shown in GENERIC SECTOR SE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1527 GAAGCGGCGTTCGTTGTGCCTGGAGCCCCAGAGGCCTGGGGGGCACCAGCCGGCGCAGGCA 1468
Generic DNA sequence to generate a random TSAR petide library. TSAR: totally synthetic affinity reagent; synthetic; binding domain; effector domain; concatenated heterofunctional protein; linker; direct; rapid; detection; screening; treatment; generic; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and detection in a screening process. Sequence 114 BP; 0 A; 2 C; 2 G; 2 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Generic DNA sequence to generate a random TSAR petide library. TSAR; totally synthetic affinity reagent; synthetic; binding domain; effector domain; concateneated heterofunctional protein; linker; direct; rapid; detection; screening; treatment; generic; ss.

Synthetic Affinity Reagents) peptides. This generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)11(TGC)(NNB)62(NNB)7(TGC)(NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic Sequences are shown in Q70466-68. Cother specific peptides generated by these generic sequences are shown in R8515-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    or compens. comprising a TSAK binding domain can be used in vivo to deliver a chemically or biologically active molety, eg. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg. monoclonal or polyclonal artibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.

Confering a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)16(TGC)(NNB)16(TGC)(NNB)1x. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.

Confer specific peptides generated by these generic sequences are shown in R5151-54. TSARS are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is comprised between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confers some degree of conformational rigidity to the peptides. The TSARs or comprise a chemically or biologically active moiety, eg. metal ion, and or in peptide, toxin or enzyme, to the specific target or on the composition or peptide, toxin or enzyme, to the specific target or on the complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score 38; DB 12; Length 114;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                 \text{n.a.} - \text{n.a.} database search, using Smith-Waterman algorithm with gap extension penalties as well as gap opening penalties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 13, Applicati
